

# Network Programming

Comp-361 : Network Programming  
Lecture 7

Alexandre Denault  
Computer Science  
McGill University  
Winter 2008

# Distributed Process

A process (or an application) that is distributed  
( separated ) across several machines.

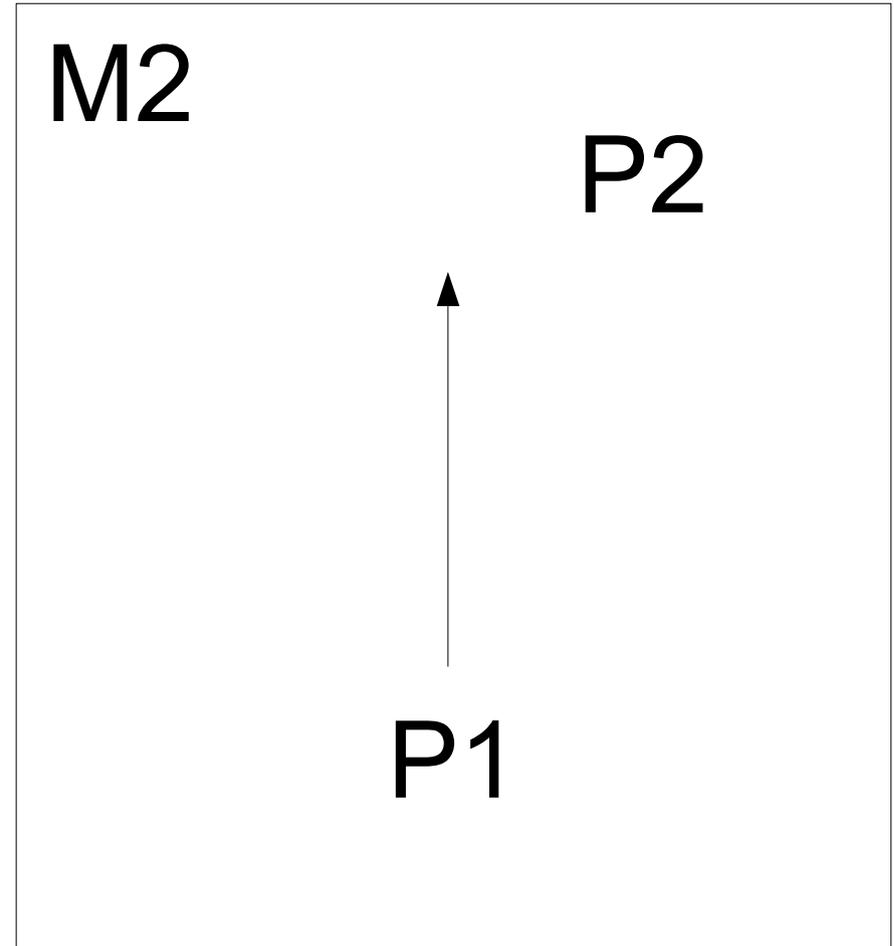

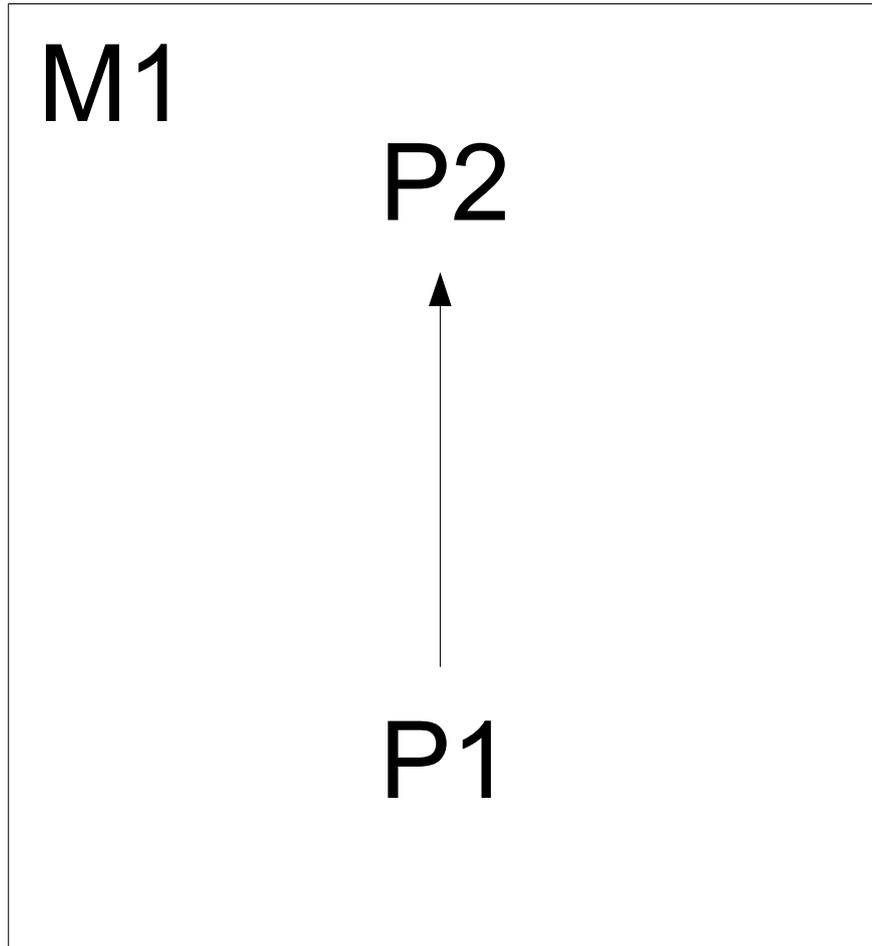

# Problems?

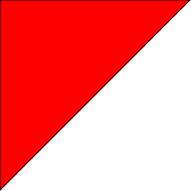

What are the problems typically associated with distributed application?

# Problems?

- Who does what?
- Performance?
- Synchronization?

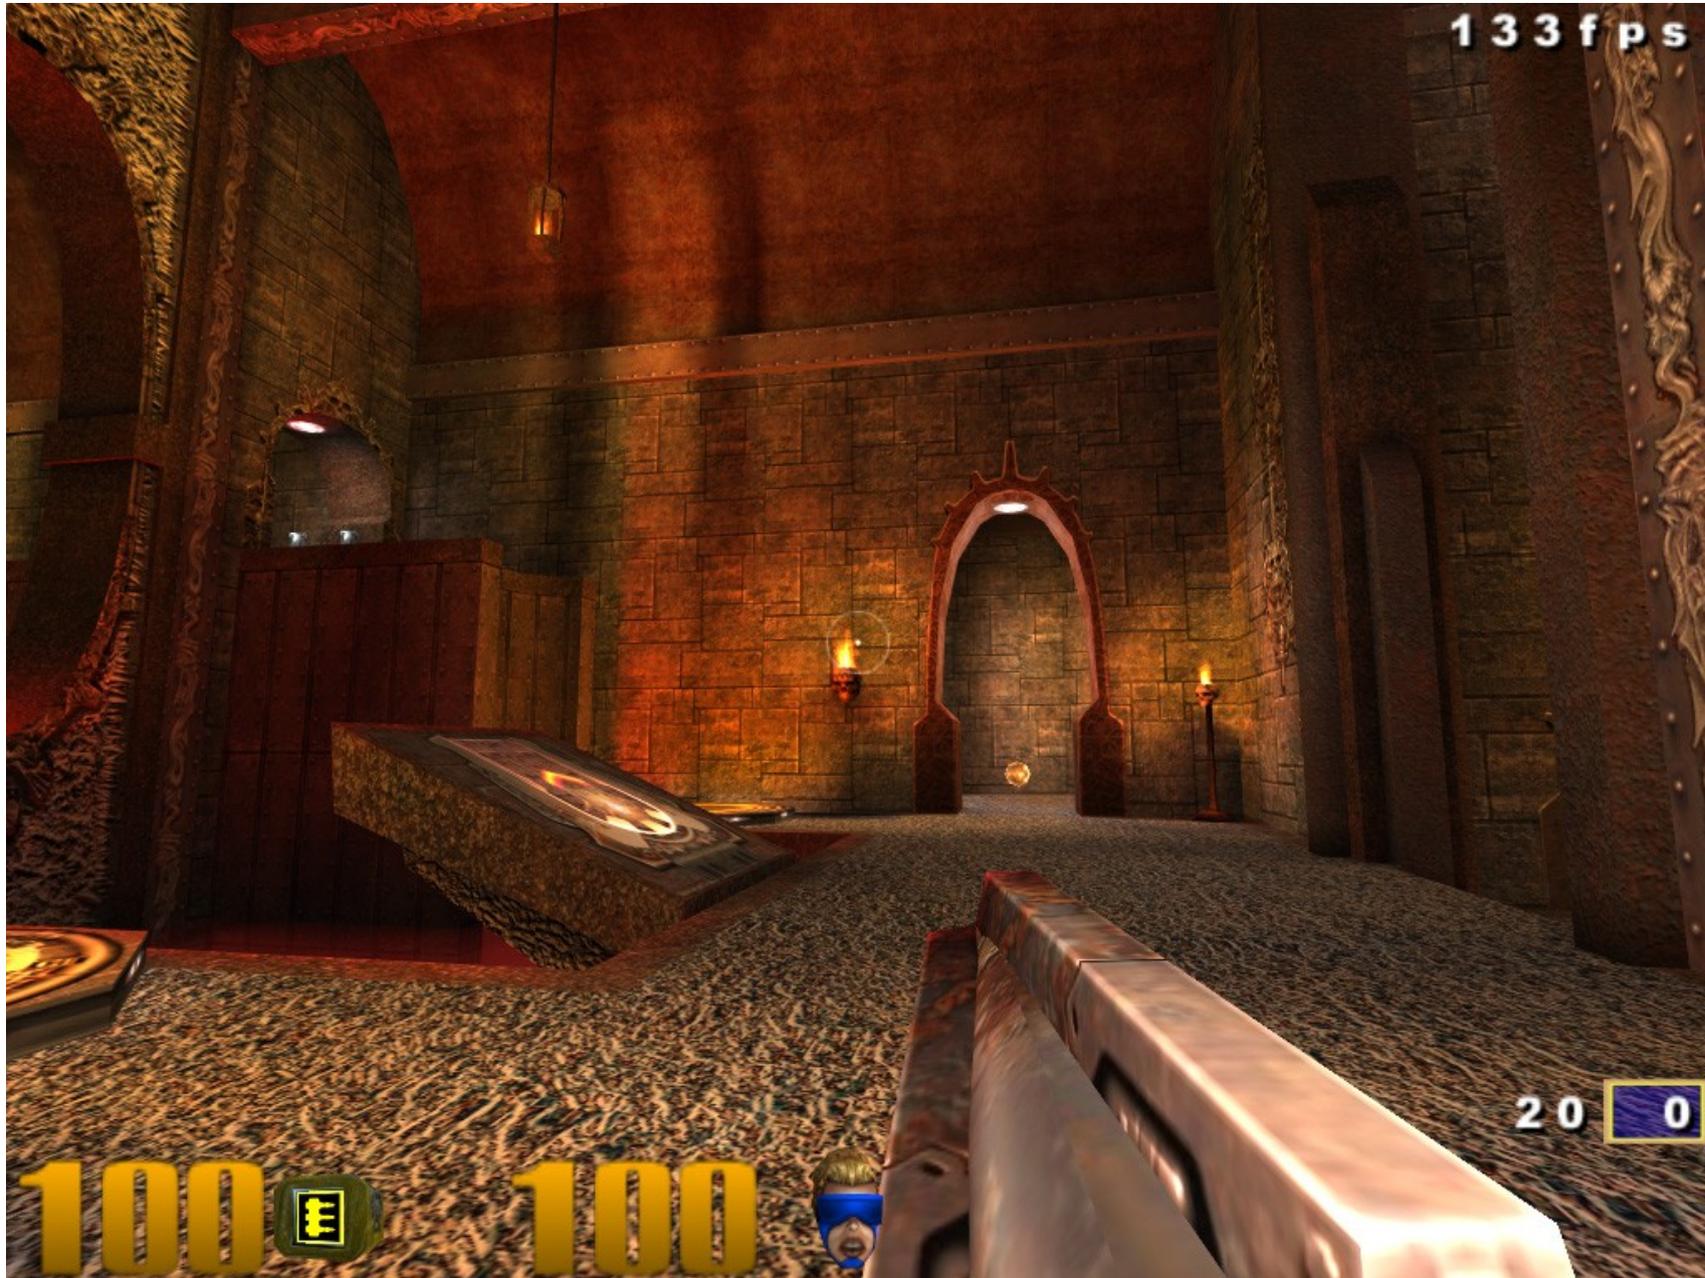

# Synchronization

# **Level of Accuracy**

# Dead Reckoning

Quake 3

# Time Lapse

Burnout Revenge

# Why turn based?

- Nice time slices
- Easy synchronization

Get your laptop out if you have one

# ISO Model

Application Layer

Presentation Layer

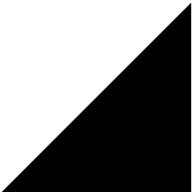

Session Layer

Transport Layer

Network Layer

Data Link Layer

Physical Layer

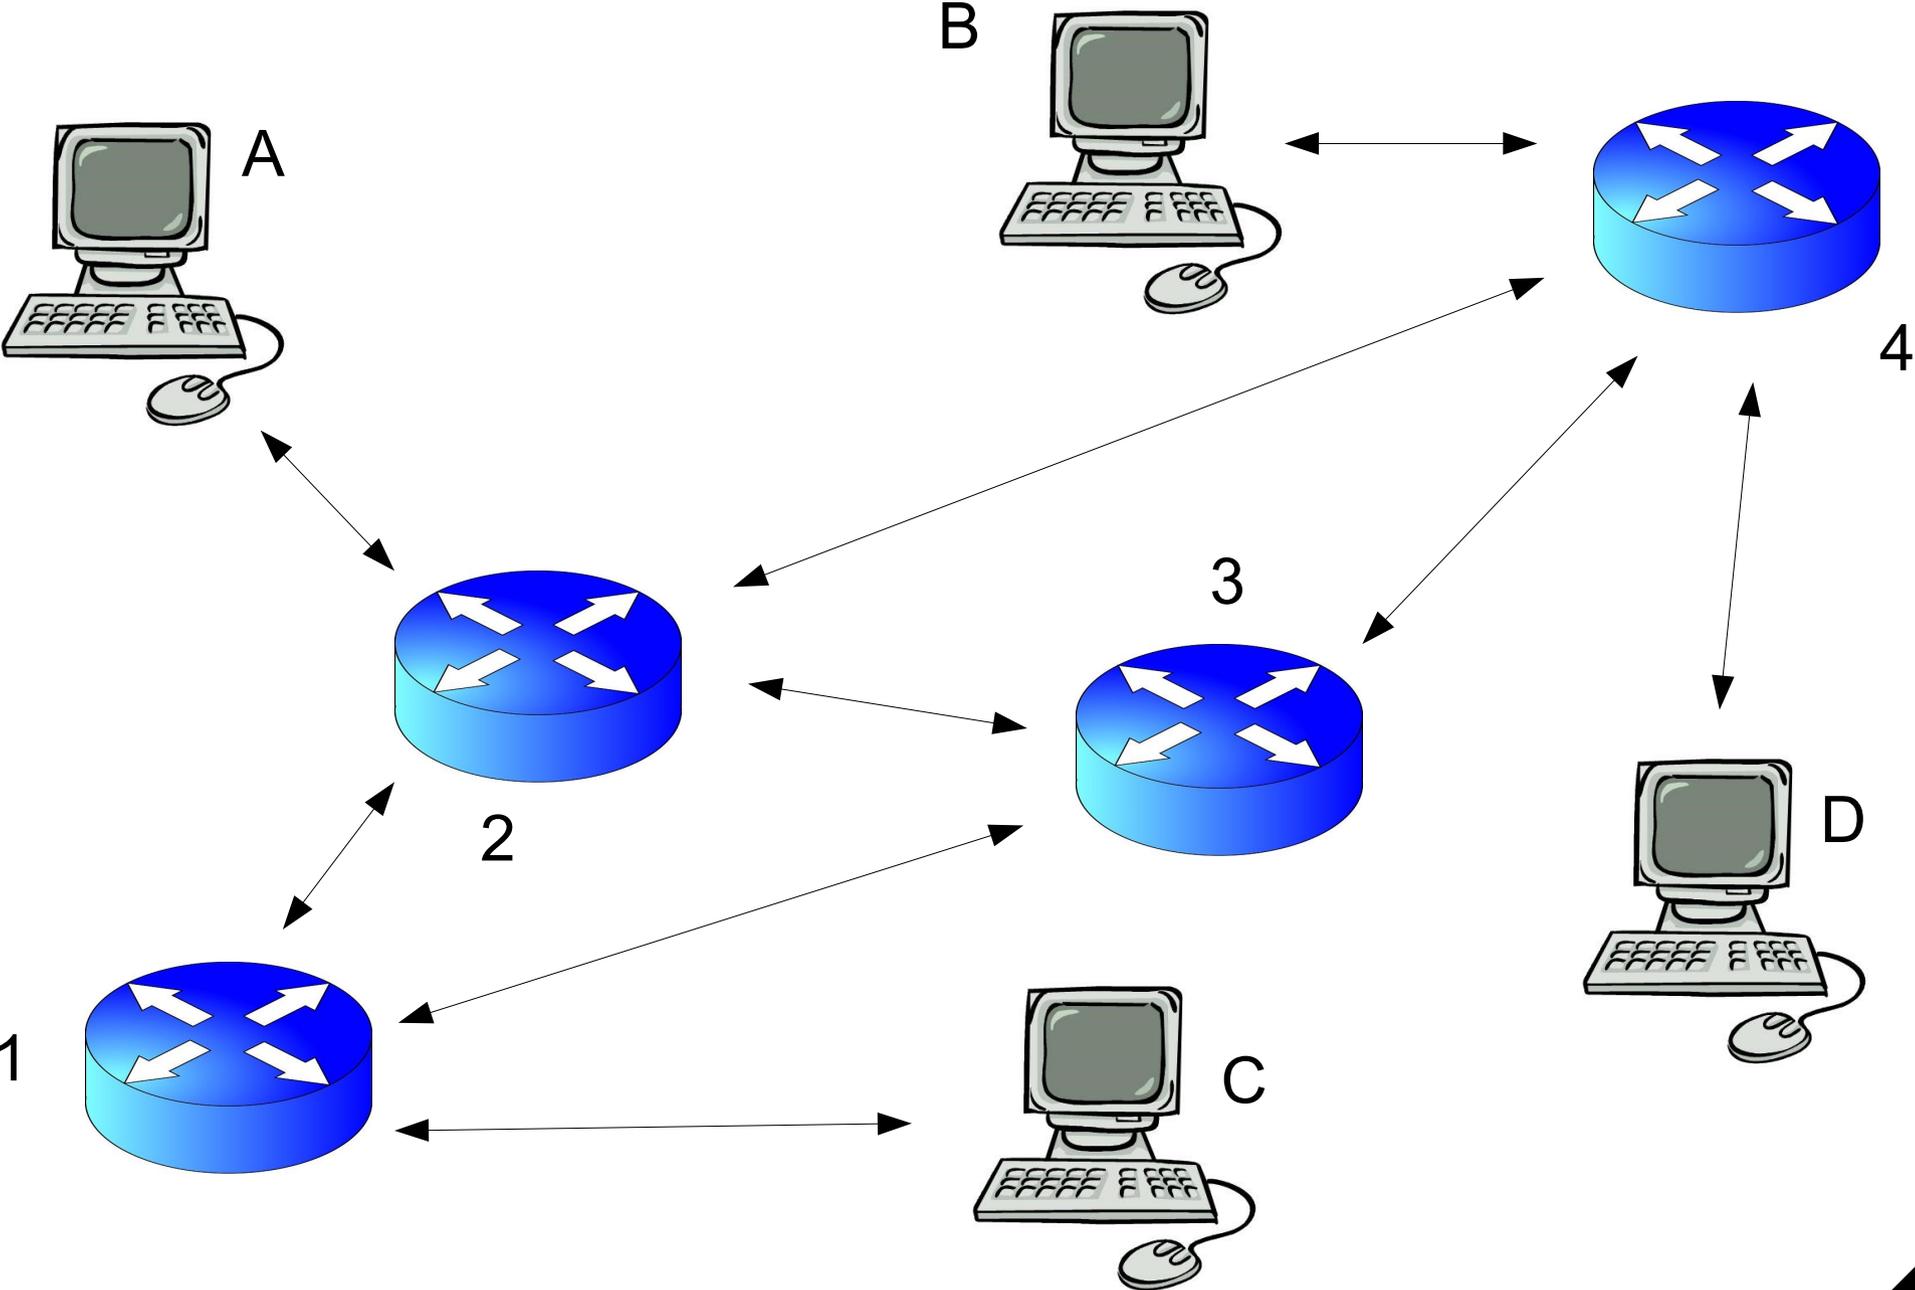

- Every unique machine has a unique address called an IP address
    - ♦ ex: 132.206.51.234 is the CS mail server
  - IP address are hard to remember
  - We use domain names instead (DNS)
    - ♦ ex: mail.cs.mcgill.ca
- 

- Every machine has a fixed number of ports (65536).
- Ports allows us to recognize IP data from different applications.
- The port range is divided as follows
  - ◆ 0-1023: The Well Known Ports
  - ◆ 1024-49151: The Registered Ports
  - ◆ 49152-65535: The Dynamic and/or Private Ports

# Important listening ports

- 20/21 : File transfer protocol (FTP)
- 22 : Secure Shell (SSH)
- 23 : Telnet
- 25 : Simple Mail Transfer Protocol (SMTP)
- 80 : World Wide Web (HTTP)
- 137/138/139 : NetBIOS (Microsoft File Sharing)
- 143 : Internet Mail Protocol (IMAP)
- 443 : HTTP protocol over TLS/SSL
- 2049 : NFS

# Routed Protocol

# Lattency

ping halo.cs.mcgill.ca

tracert halo.cs.mcgill.ca

or

tracert halo.cs.mcgill.ca

now ssh to mimi and try it again

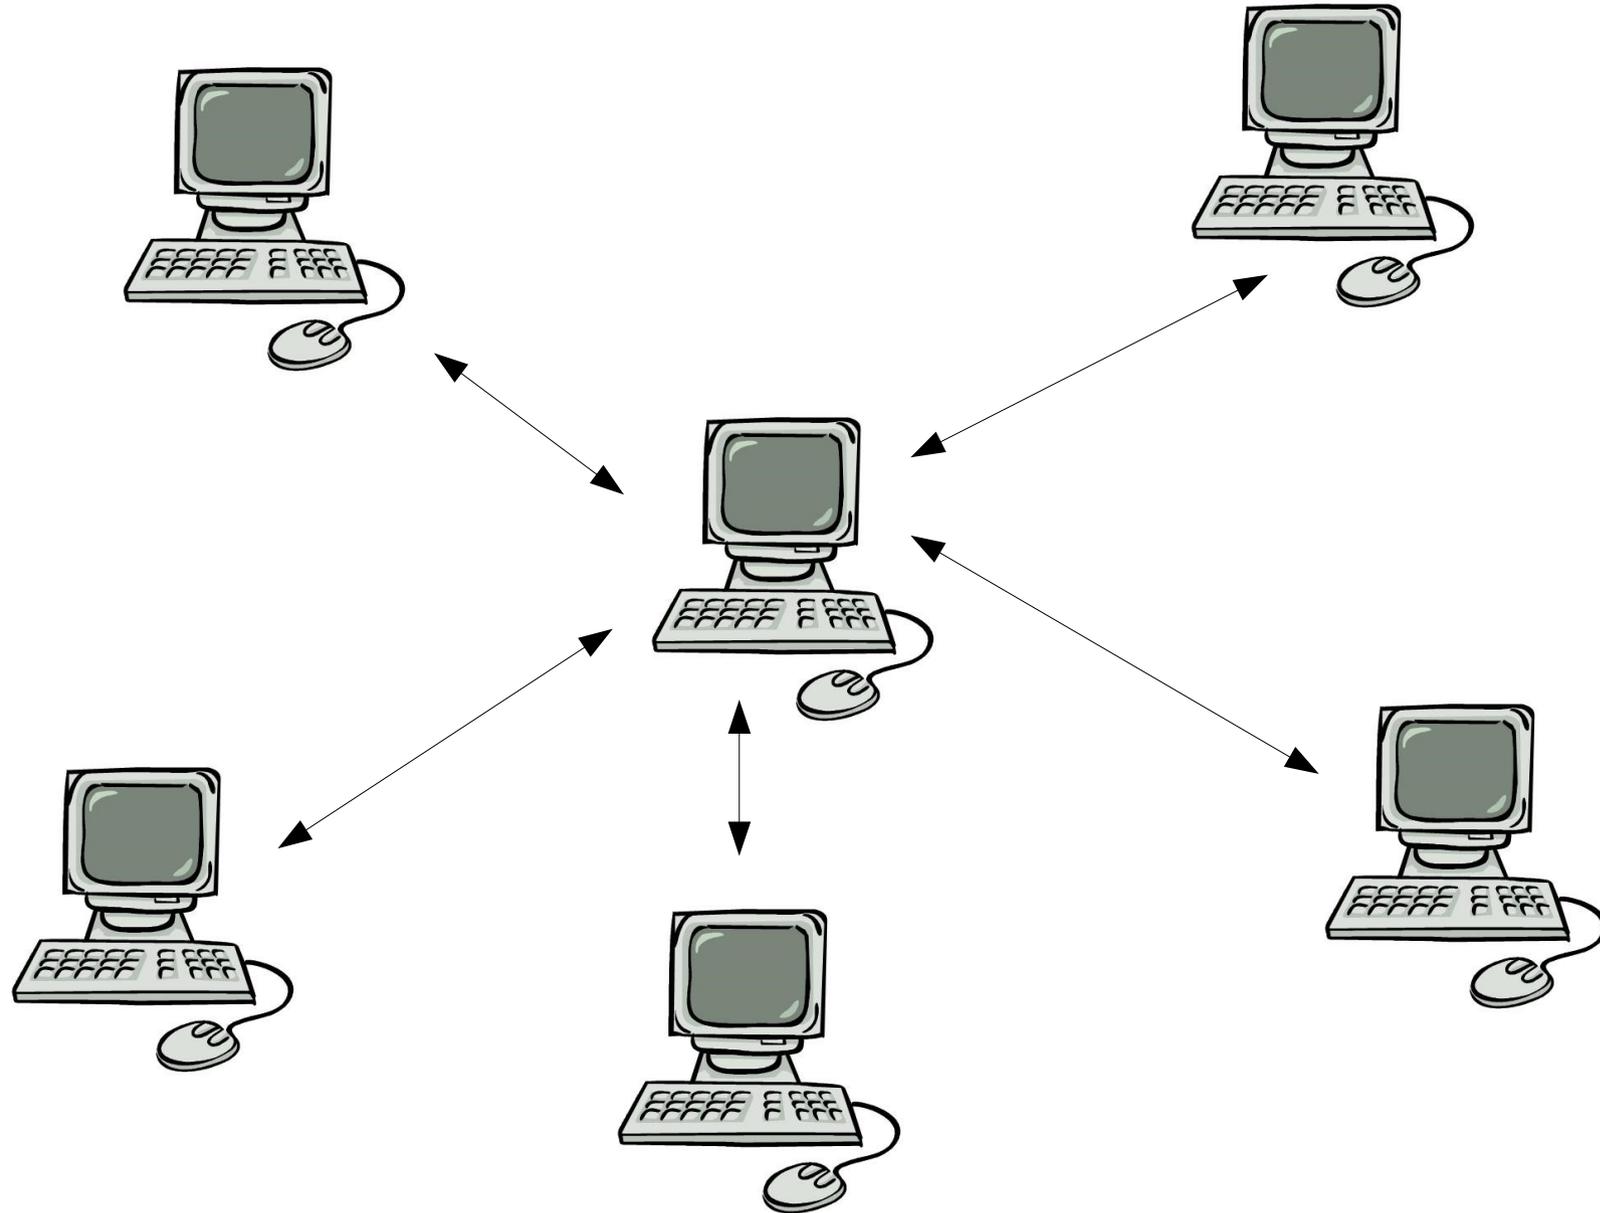

# TCP Sockets

- Connection using Session
- Provides extensive features
  - ◆ error handling
  - ◆ flow control
  - ◆ message ordering
  - ◆ etc ...

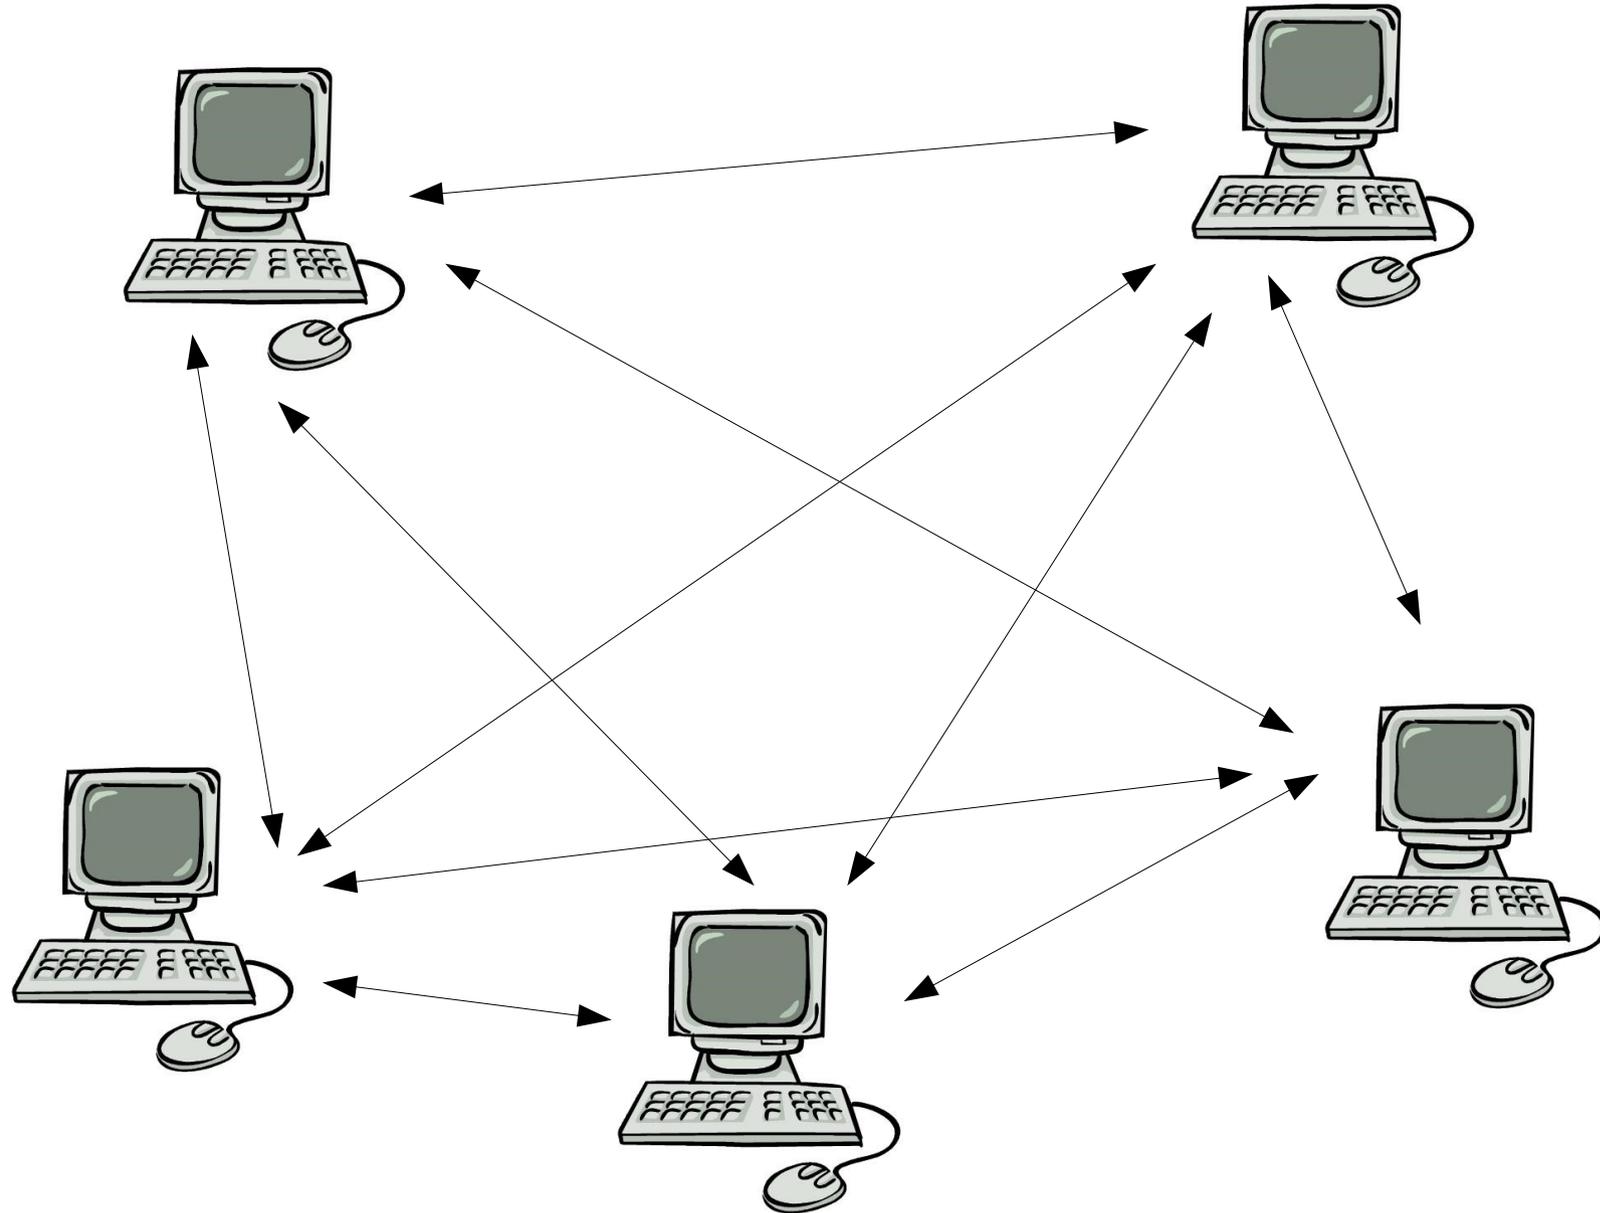

# UDP Sockets

- Work in a connectionless mode
- Much faster than typical TCP connections
- Provides no error handling (detection, recovery, etc)

# Connection Model : Client/Server

# Connection Model : P2P

# Lets compare

- Setup
- Speed
- Authority
- Synchronization
- Fault Tolerance

# What to send?

- Events vs Results

# What to send?

- Text vs Object

# What is Serialization

Serialization is the process of taking the memory data structure of an object and encoding it into a serial (hence the term) sequence of bytes. This encoded version can then be saved to disk, sent across a network connection, or otherwise communicated to a recipient.

-- [Wikipedia.org](https://en.wikipedia.org)

# Remote Method Invocation

- Create remote copies of objects.
- Execute methods remotely on those objects.
